

There has been no proof presented to persuade me to think that BPL will not be a interfering means. This technology has been shown to hamper our freedom to enjoy the radio spectrum as it is. Once the big backers of this technology gain their foothold with it's use, there will be no way for the community to gain cooperation in interference issues generated by their BPL. If anybody wants to subscribe to provider of the internet you can use the very efficient cable system or if in remote area's, the satellite system is available. I recommend that BPL not be given the go-ahead to develop.
